Outpatient CT (head, neck, extremities)

Welcome to the Animal Dental Clinic and Oral Surgery Clinic.

At ADC/OC we diagnose and treat severe oro-facial disease and trauma.

A big part of our maxillofacial diagnostics is the use of **Cone Beam CT technology**. It provides instant **3-D viewing** and *high definition* imaging of the head that we find extremely useful. It is also useful for the neck and extremities (areas we do not treat).

We'd like to offer this technology to you for your patients. It can aid in the diagnosis of those *difficult conditions* you are treating. For example:

- Nasal cavity (chronic sinusitis, discharge, air flow obstruction, etc.)
- Ears - tympanic bulla, inner, middle and external ear anatomy (chronic infection, polyps, neoplasia, etc.)
- Neck - bony trauma, subluxation, stenotic canal, etc. (*Note MRI is better for soft tissue, CT is good for bone*).
- Extremity lumps, bumps & lameness (elbow/stifle and distal anatomy)

What can you expect?

An outpatient CBCT is for patients being referred for CT and interpretation only.

All outpatient CTs will have a pre anesthetic exam with one of our surgery doctors the morning of the CT. This doctor will work with you to make sure you get the best diagnostic images possible. All CTs sent to and reviewed by a radiologist. Our doctor can be available for tissue collection.

Pre-visit request:

- 1) Current lab work within 3 months
- 2) The last year of medical records
- 3) Outpatient CT form completed by rDVM
- 4) All information is required 2 days prior to the procedure. Urgent cases can be accommodated as needed. Please call the office for more information.

The cost of the outpatient CT, Interpretation +/- contrast is \$850.00 to \$1100.
